

JavaScript Notes — Day 1

Chapter 1: Introduction to JavaScript | Date: 17/05/2026

Today's Topics

- 1 Variables
- 2 Data Types

Problem 1 — Object with product details

```
const products = {  
  title: "ball pen",  
  price: 10,  
  rating: 4.5,  
  offer: 5  
};  
console.log(products);
```

Problem 2 — Object with profile details

```
const profile = {  
  username: "chintu",  
  isFollow: false,  
  followers: 1000,  
  following: 500  
};  
console.log(profile);
```

Keywords: Variable Declarations

Keyword	Reassignable?	Scope	Notes
const	No	Block	Object/array contents can still be mutated
let	Yes	Block	Preferred for variables that change
var	Yes	Function	Hoisted; avoid in modern code

Example:

```
const name = "chintu";
```

Data Types in JavaScript

Type	Description	Example
string	Textual data, in <code>' '</code> , <code>" "</code> or <code>` `</code>	"Hello, World!"
number	Integers and floating-point numbers	42, 3.14
boolean	Logical value: true or false	true, false
null	Intentional absence of any value	null
undefined	Declared but not assigned a value	undefined
object	Complex data with key-value pairs	{ name: "chintu", age: 25 }
BigInt	Integers beyond the safe integer limit	9007199254740991n

Rules for Naming Variables

- Must begin with a letter, underscore (`_`), or dollar sign (`$`) — cannot start with a number.
- Can contain letters, numbers, underscores, and dollar signs — no spaces or special characters.
- Case-sensitive — "myVariable" and "myvariable" are different variables.
- Should not be a reserved keyword (var, let, const, if, else, etc.).

Type Casting

Type casting is converting a value from one data type to another, using built-in functions or operators.

Example — converting a string to a number:

```
const str = "42";
const num = Number(str);
```

Connecting JavaScript to HTML

Use the `<script>` tag in an HTML file. JavaScript can be written directly inside the tag, or linked from an external file using the `src` attribute (typically placed after the `<body>` tag).

```
<script>
  // Your JavaScript code here
</script>

<!-- or -->
<script src="path/to/your/javascript/file.js"></script>
```
